Leading Telecommunications Provider in Canada

THE SITUATION

Company with revenues of more than USD 18 billion

- ✓ Bell Canada needed a secure and efficient method for managing and sharing credentials across departments and with external partners.
- ✓ Credential sharing with third parties, such as contractors and partner companies, was often handled through informal and insecure methods.
- ✓ Lack of visibility and accountability in shared password usage created compliance and operational risks.

Problem

Shared credentials lacked proper monitoring, which increased the risk of unauthorized access and data breaches.

Shared passwords were prone to mishandling, exposing Bell Canada to potential data leaks and compliance violations.

Solution

MySafe provided a unified platform for managing and securely sharing credentials with individuals, groups, and external partners.

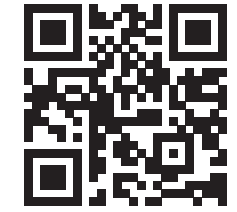

Comprehensive logging of who accessed or modified credentials and when, ensuring full visibility and accountability.

Results

All credentials for shared accounts and external access were securely managed and monitored.

Reduced risk of leaks or breaches.

Teams and external partners accessed shared resources securely and efficiently, enhancing productivity.
